

Sebastien Monchy
BROOKHAVEN NATIONAL LABORATORY

In November 2007, I started as a research associate, a post-doc in the biology department.

I obtained my doctorate degree from the University of Bruxelles, in summer 2007. During my thesis, I was working on the genetic potential of bacteria for environmental depollution and bioremediation purposes.

Now, in BNL, I'm studying the plant growth-promoting effect of bacteria, in order to produce faster and more biomass with the further idea of using other bacteria to degrade the cellulose into ethanol. The final aim will be to improve the production of biogas, and to reduce the USA energy importation. So, if you want cheap gas for your car, vote for me!

I would like to keep the fun, relaxed and nice spirit that make ASAP a great place for graduate student and Post-doc to get together in a friendly atmosphere.
