HTS Magnet R&D Program at BNL

We are developing "conductor friendly designs" for several applications based on flat racetrack coils with large bend radius. All can use HTS.

We have started a magnet R&D program that systematically develop technology and design principle for future HTS magnets. 10-turn coil program has been quiet successful so far.

BNL has expertise in a variety of areas which provide an opportunity to develop not only good vendor-user relation but a collaboration to further develop this field. We have common interest.

High Field Magnet Design

Design Issues:

- Must use brittle superconductors

Nb_3Sn , HTS

- Large Lorentz forces
- Large energy deposition

Conventional design (e.g., RHIC magnets)

- Complex 3-d geometry -- not suitable for high fields

Conductor friendly racetrack coil geometry (separate program)

- Suitable for high field magnets with brittle material

Common Coil Design (The Basic Concept)

Main Coils of the *Common Coil Design*

- **Simple 2-d geometry** with large bend radius (ρ)
- **Conductor friendly** (no complex 3-d ends, suitable for brittle materials - most for H.F. are - Nb₃Sn and HTS)
- **Compact** (compared to single aperture LBL's D20 magnet, half the yoke size for two apertures)
- **Block design** (for handling large Lorentz forces at high fields)
- **Combined function magnets** possible
- **Efficient and methodical R&D** due to simple & modular design
- **Minimum requirements** on big expensive tooling and labor
- **Lower cost magnets** expected

Magnet Design for ν Factory Storage Ring

Superconducting
Magnet Division

Design Principles and Requirements:

Decay products clear
superconducting coils

Compact ring to minimize
the environmental impact
(the machine is tilted)

⇒ Need high field
magnets and efficient
machine design

Storage ring magnet design
(simple racetrack coils with open midplane)

Efficient Magnet System Design for Good Field Quality in Body & in Ends

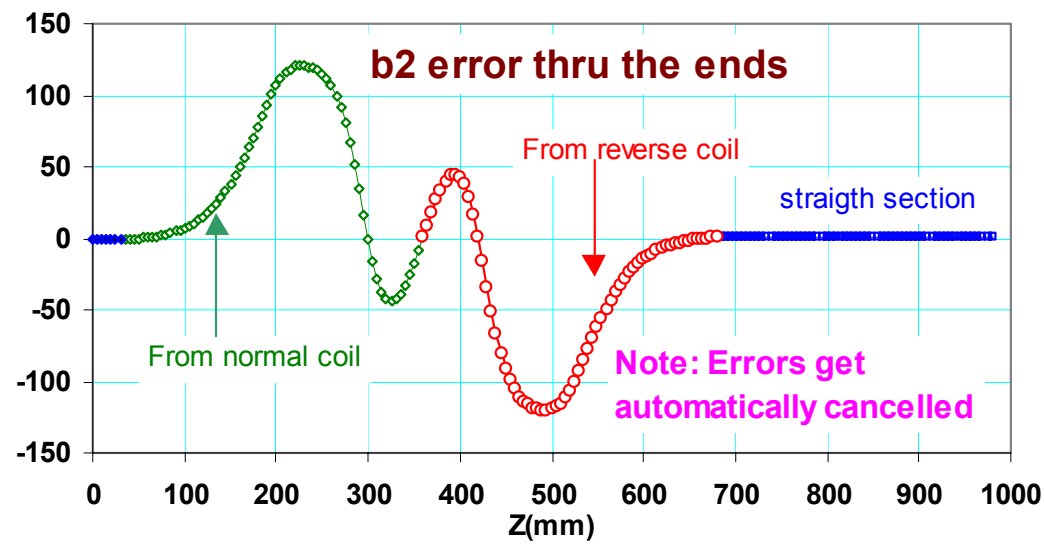

Normal Coils
Dipole

Reverse Coils
Skew Quad

(Reverse coils cancel field errors in the ends)

One Coil
1/2 & 1/2

No space is wasted.

- Two normal coils makes a dipole
- Reverse field coils makes a skew quad
- Space between the two coil ends makes a combined function magnet region

Status and Progress

**Superconducting
Magnet Division**

Significant progress (accomplishments) and innovations to date

- **Conceptual design completed**
- **Initial magnetic and mechanical analysis performed**
 - magnet design is strongly coupled with the lattice design (being developed in parallel under different funding)
- **A method to obtain large reverse curvature devised**

New Magnet Design For Efficient VLHC-2 Interaction Region

Optics and magnet requirements (field & aperture) depends crucially on the minimum spacing in the first 2-in-1 IR Quad (doublet optics)

23KW of beam power radiated from the IP makes this a natural for HTS

Conventional 2-in-1 cosine theta design

Panofsky 2-in-1 quad design

Modified Panofsky Quad

Conductor friendly and better field quality design

Spacing depends on the conductor and support structure requirements

(Bo not zero)

Support structure and middle conductor is removed/reduced. This reduces spacing between two apertures significantly.

Expected Performance of HTS-based Magnets

Year 2000 data for J_c at 12 T, 4.2 K

Nb₃Sn: 2200 A/mm²
BSCCO-2212: 2000 A/mm²

Near future assumptions for J_c at 12 T, 4.2 K

Nb₃Sn: 3000 A/mm² (DOE Goal)
BSCCO-2212: 4000 A/mm² (2X from today)

Expected performance of all Nb₃Sn or all HTS magnets at 4.2 K for the same amount of superconductor:

Year 2000 Data	
All Nb ₃ Sn	All HTS
12 T	5 T
15 T	13 T
18 T	19 T*

*20 T for Hybrid

Near Future	
All Nb ₃ Sn	All HTS
12 T	11 T
15 T	16 T
18 T	22 T

Cu(Ag)/SC Ratio

BSCCO: 3:1 (all cases)
Nb₃Sn: 1:1 or J_{cu}=1500 A/mm²

Common Coil Magnet R&D at BNL

Superconducting
Magnet Division

Primary Goal of the Program:

Design and build a ~12.5 Tesla, “React & Wind” Common Coil Magnet with HTS playing a major role.

R&D Plan to Develop Technology:

A “*mini 10-turn magnet R&D program*” to systematically develop and test new ideas, designs and technologies (React & Wind HTS) in a time and cost effective manner.

With a fat turn-around and relatively lower developmental cost, we can afford to built many coils in order to systematically develop new technology.

That philosophy is in-built in the “Program Design”!

Nb₃Sn Reaction Facility at BNL

Superconducting
Magnet Division

Nb₃Sn cable after reaction.

Large (1.5 m³) reaction furnace at BNL.
It was used for making full length Nb₃Sn magnets.

10-turn Vacuum Impregnated Cable sample

Cable Insulation Test Setup

The Bobbin and the 10-turn Coil

Superconducting
Magnet Division

The bobbin
(the coil is wound on it)

The first 10-turn practice coil
(removed from bobbin after
impregnation)

The complete cassette module
(vacuum impregnated coil in bobbin)

Nb₃Sn Cable Coming Out of Spool

**Superconducting
Magnet Division**

The coil is wound like a regular NbTi coil, of course with proper care (e.g., lower tension). This should help establish procedure, care (cost) required for Nb₃Sn magnets.

Coil Tensioner with 10-turn coil on the Winding Table

10-turn Coil Being Prepared for Vacuum Impregnation

HTS Coil Wound by Hand

Fiberglass Sleeve from LBNL

Vacuum Impregnation Setup

Vacuum Impregnated Coils

Superconducting
Magnet Division

Vacuum impregnated coils made after “react and wind” technique.
This picture was taken after the coils were tested and removed from the support structure.

HTS Coils in Support Structure

**Superconducting
Magnet Division**

Coils are heavily instrumented.
There is a voltage tap after each
turn. Data were recorded from all
26 voltage taps.

Coils are assembled for the most
flexible and extensive testing. Four
leads are taken out of the cryostat.
During the test the coils were
powered separately and together in
“common coil” and “split-pair
solenoid mode”.

Two hall probes (in between two
coils and at the center of two coils)
also recorded the central field.

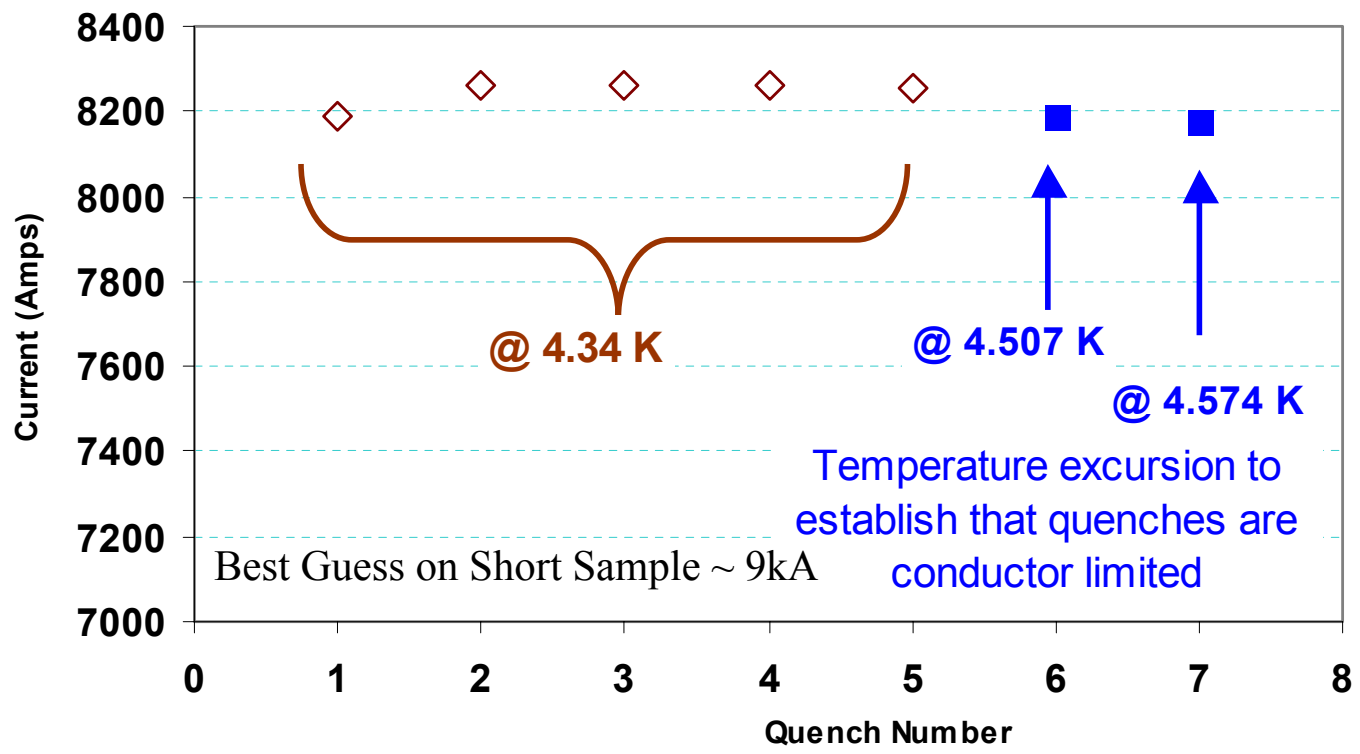

First Step: Test The Design and Construction Techniques with React & Wind Nb₃Sn Coils

Superconducting Magnet Division

Test the design with Nb₃Sn coils to eliminate major design & construction flaws

same design (common coil) and similar technology (react & wind)

A reasonable quench performance (one training quench) and relatively small additional cable degradation in first attempt, despite brittle Nb₃Sn being subjected to high strain of NbTi coil making process, is an encouraging sign for the future of "React & Wind" common coil magnets (including scale up process).

Nb₃Sn coils were wound by machine and HTS Coils were wound by hand but both have the same 70 mm bend radius.

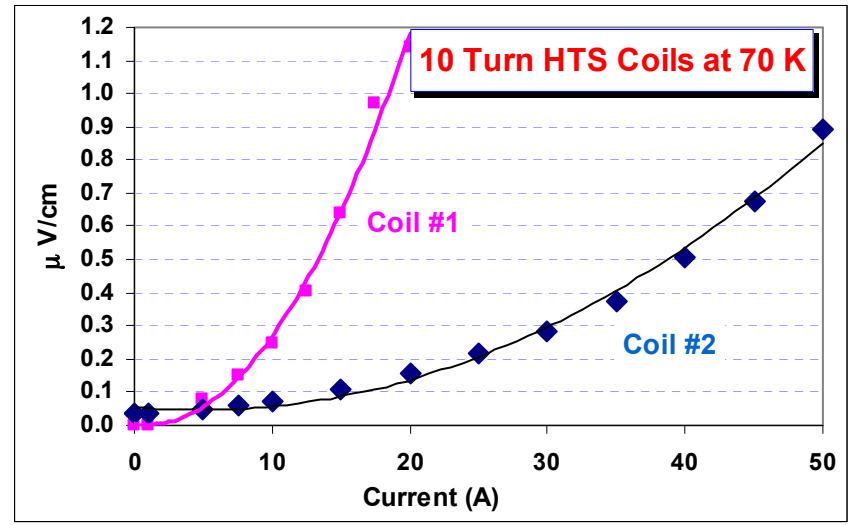

Common Coil Magnets With HTS Cable

Superconducting
Magnet Division

HTS cable coil prior to vacuum impregnation

Two coils were tested in Liquid Nitrogen

A coil cassette made with HTS cable after vacuum impregnation and instrumentation

The HTS cables were from two different batches. They behaved differently:

- Different I_c
- Different T_c

Based on preliminary analysis, no large degradation was observed.

Magnet Division**

ASSEMBLIES
N FOR REF

**Superconducting
Magnet Division**

Potential Cable Test Facility for Testing Small Samples

Flat cable (or wire) can be put in the little space between the coil and it becomes a cable test facility.

A Personal Opinion

The "Common Coil Geometry"
provides a unique and flexible
"Test Facility"* for conductor
and magnet development.

*a.k.a.:

Magnet R&D Factory

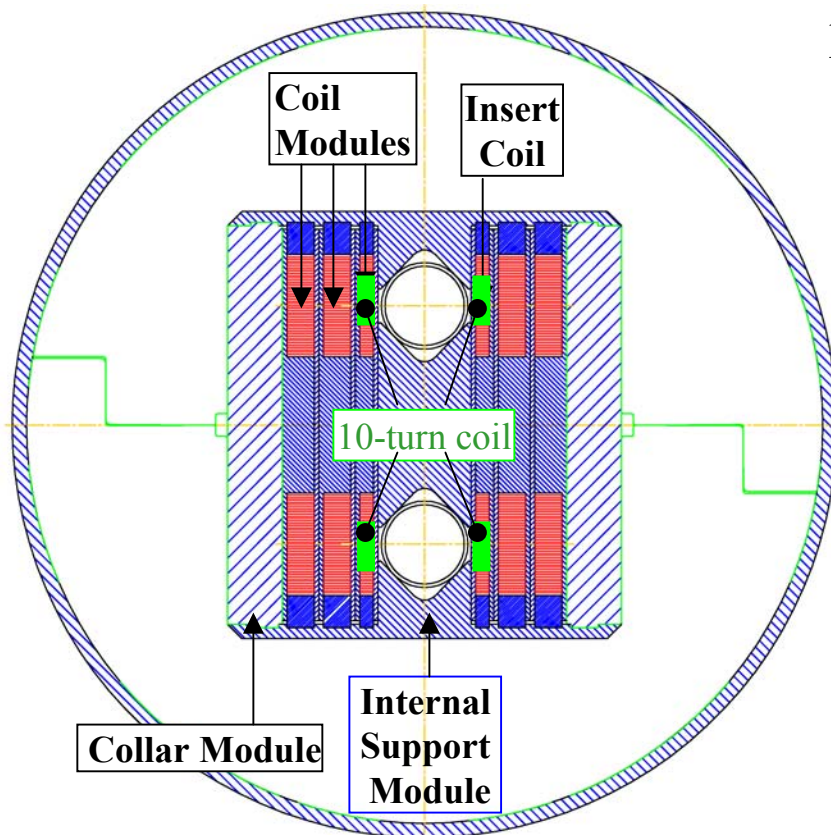

Life of 10-turn Coil Program After 12.5 T Magnet

While we optimize the 12.5 T design for cost, performance and large scale production,

the 10-turn coil technology development program continues in parallel!

12.5 T magnet becomes a part of “magnet R&D test factory”

The 12.5 T magnet provides a significant background field facility for testing coil modules (HTS, Nb₃Sn) with large Lorentz forces on them -- try to simulate high field magnet situation.

Ideal approach for HTS/Hybrid magnet development !

HTS in a Hybrid Magnet

- Perfect for R&D magnets now. HTS is subjected to the similar forces that would be present in an all HTS magnet. Therefore, several technical issues will be addressed.
- Also a good design for specialty magnets where the performance, not the cost is an issue. Also future possibilities for main dipoles.
- Field in outer layers is $\sim 2/3$ of that in the 1st layer. Use HTS in the 1st layer (high field region) and LTS in the other layers (low field regions).

Common Coil Magnet As A Test Facility

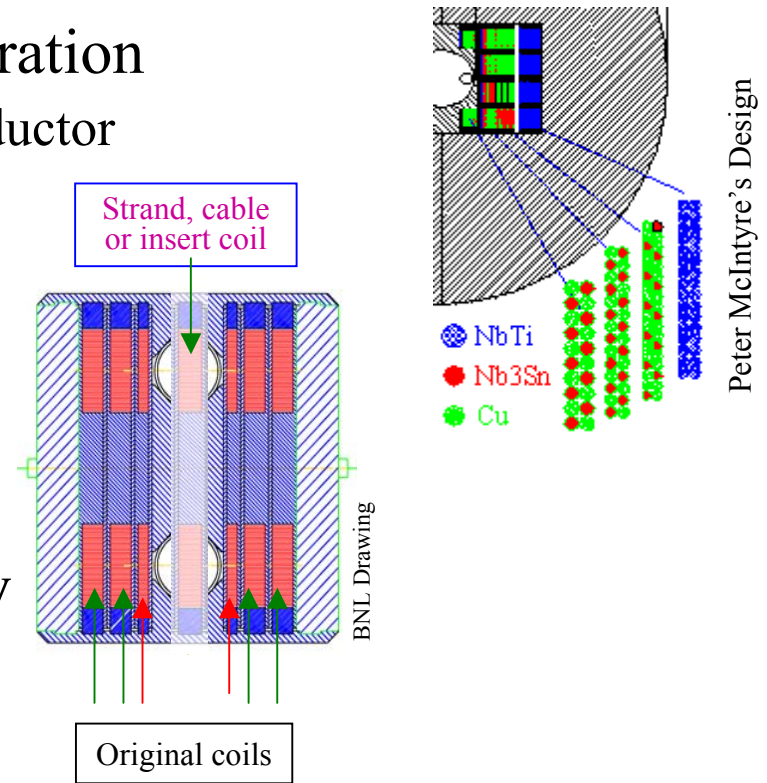

- **A Modular Design with a significant flexibility.**
- **Coil geometry is vertical and flat. That means a new coil module having even a different cable width can be accommodated by changing only few parts in the internal support structure.**
- **The central field can be increased by reducing the separation between the coils.**
- **The geometry is suitable for testing strands, cables, mini-coils and insert coils.**
- **Since the insert coil module has a relatively small price tag, this approach allows both “systematic” and “high risk” R&D in a time and cost-effective way. This might change the way we do magnet R&D.**
- **Can use the successful results in the next magnet.**

A Few Possible Topics for Cable and Magnet Designs

Examples of systematic and non-conventional design studies:

- Variation in cable/conductor configuration
 - Mixing Cu strand with Nb₃Sn superconductor
 - Heat treatment studies
- Different technologies
 - “Wind & React” Vs. “React & Wind”
- Different type of conductors
 - Nb₃Al, HTS, etc.
- Different type of conductor geometry
 - Tape, cable
- Stress management module
- Different type of mechanical structures and variations in them
- Different cable insulation and insulating schemes

Magnet Test Results

Superconducting
10-Turn HTS coil. Measurements at every turn
Magnet Division

Common coil magnet with Nb₃Sn

Ramped to 86% (power supply limit) of cable short sample limit (11kA) measured at BNL

One quench at 9.7 kA flattop

Another quench at ~6500 A at a ramp rate of 62,000 A/sec (NO TYPO)

Magnet does not quenching after ~10 ramps, tried various ramp rates.

Unlike others, we do not see any large ramp rate degradation till 1500 A/sec

Typical criterion for HTS to turn normal: 1μV/cm

Measured Performance of HTS Cable and Tape As A Function of Field at BNL

Superconducting Magnet Division

Note: Tape and wire have about the same area. Cable has 18 wires (strands).

Measurement of "BSCCO-2212 cable" at BNL test facility
(Ic is better by a factor of 2 now)

Measurement of "BSCCO 2223 tape" wound at 57 mm diameter with applied field parallel (1 μ V/cm criterion)
(field perpendicular value is ~60%)

Possible HTS Hybrid Magnet designs
with Nb₃Sn coils of 12.5 T Design

Field Test Range: 8-20 Tesla (with BSCCO 2212 wire carrying 600 A at 4K and 0T)
 Aperture (coil spacing) Range: 0 to 40 mm
 Above design use 1 or 2 layers of HTS coils with 0 to 2 layers of Nb₃Sn coils
