Abstract

BNL plans to build a partial helical snake for polarized proton acceleration in the □ It will be a 3 Tesla superconducting magnet having a magnetic length of 1.9 meter □ AGS needs only one magnet; no plans to build a prototype. The first magnet function at the design field and provide the required field quality, spin rotation, etc. □ New software is developed to exchanges input/output between the field d programs, CAD programs and programs that drives the machine to cut the metal.

3

The axial component of the field along the nominal beam path. The integral value is made zero with the help of a solenoidal winding on the beam tube.

SUMMARY

The design and analysis of a partial helical snake for AGS has been completed. A number of software techniques have been developed to obtain a design that satisfies the basic requirements.
