Common Coil Magnet As A Test Facility

m

cccc

- A Modular Design with a significant flexibility.
 - Coil geometry is vertical and flat. That means a new coil module having even a different cable width can be accommodated by changing only few parts in the internal support structure.
 - The central field can be increased by reducing the separation between the coils.
 - The geometry is suitable for testing strands, cables, mini-coils and insert coils.
 - Since the insert coil module has a relatively small price tag, this approach allows both *"systematic"* and *"high risk"* R&D in a time and cost-effective way. This might change the way we do magnet R&D.
 - Can use the successful results in the next magnet.

A Few Possible Topics for Cable and Magnet Designs

Strand, cable or insert coil

Original coils

Examples of systematic and non-conventional design studies:

- Variation in cable/conductor configuration
 - Mixing Cu strand with Nb₃Sn superconductor
 - Heat treatment studies
- Different technologies
 - "Wind & React" Vs. "React & Wind"
- Different type of conductors
 Nb₃Al, HTS, etc.
- Different type of conductor geometry

 Tape, cable
- Stress management module
- Different type of mechanical structures and variations in them
- Different cable insulation and insulating schemes

NL Drawing

A Common Coil Design Study With A Reduction in Insulation Volume

A Common Coil Design with all harmonics $< 10^{-5}$ (geometric).

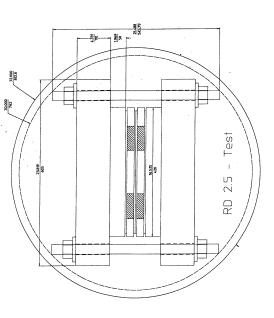

Uses a different cable in auxiliary coils to simulate tilted blocks with two flat blocks. All conductors are in series.

RD3 Reincarnations for A Test Facility

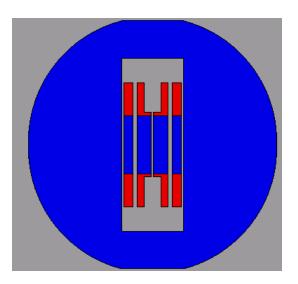

Purpose of this exercise

• Design a Test Facility with RD3 components.

Use RD3/RT1 coil modules.

Minimize new components.

RT1 (uses RD3 outer coils) ~12 T

No Real Gap/space between coils.

RD3 : 13.7 T -- 40 mm coil aperture; but really too small a space (after internal structure) for using it as a Test Facility.

Common Coil Magnet As a Facility for Conductor and Magnet Development

Superconducting Magnet Program

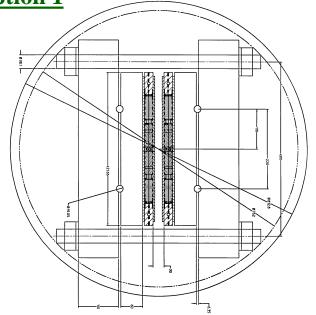

Ramesh Gupta

Slide No. 5/9

Test Facility with Outer Coils Only

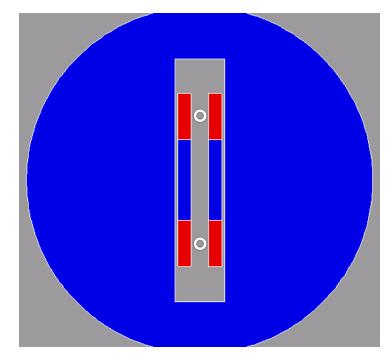

Option 1

Modified RT1 for facility with 30 mm coil spacing.

Bss ~11.5 T

Option 2

Outer Coils in RD3-type structure with iron yoke -- 30 mm coil spacing Bss ~12.1 T

Slide No. 7/9

RD3 with inner coils flipped (Bill Barletta's suggestion)

The above geometry puts the structure blocking the test space on the other side. Bss ~13.7 T for 30 mm separation

Bss ~ 13.2 T for 40 mm separation

* The above trick worked because of a peculiar situation that the outer coil had $\sim 15\%$ margin over the inner coil.

Common Coil Magnet As a Facility for Conductor and Magnet Development

Summary of Test Configurations

REFERENCE DESIGN STUDIES :						
(not suitable for a test facility)	Bss	Stored Energy	Fx	Fy		
	(T)	(J/mm)	(N/mm)	(N/mm)		
RD3 original design as per spec (40 mm aperture)	14.3	1800	9200	260		
RD3 (with Nb3Sn strand data for inner & outer coils)	13.7	1640	8450	240		
RD3 outer coils (no real gap - 9.5 mm coil sepation)	12.6	240	4850	-200		
RT1 outer coils only - no yoke and no real gap)	12.1	240	4160	-170		

Possible configurations for a test facility	Bss	Stored Energy	Fx	Fy
	(T)	(J/mm)	(N/mm)	(N/mm)
RD3 outer coils only with yoke (30 mm separation)	12.1	520	5170	-210
RT1 outer coils only and no Yoke (30 mm separation)	11.5	520	4010	-170
RD3 outer + "inner coils flipped" (30 mm separation)	13.7	1800	8390	621
RD3 outer + "inner coils flipped" (40 mm separation)	13.2	2080	8330	770
RD3 inner coils flipped (30 mm - No yoke, structure?)	13.3	1760	6070	160

A configurations for a high field coil test	Bss	Stored Energy	Fx	Fy
	(T)	(J/mm)	(N/mm)	(N/mm)
RD3 inner coils flipped; same structure (almost no gap)	14.7	1120	8340	120

Some of these calculations are preliminary (only 2-d calculations).

However, 3-d (end) effects, etc. are not expected to reduce the computed short sample by over 1 tesla.

In Conclusion, A Personal Opinion:

The "Common Coil Geometry" provides a unique and flexible "Test Facility*" for conductor and magnet development.
